
LCB-1/2/3 are one rule at increasing uncertainty penalty and are shaded light to dark. The penalty degrades high-selectivity event recovery toward random ranking and improves the near-zero objective: the ordering inverts between columns. Bars are fold means, error bars fold SD ($n = 5$). True hit@k is not shown - it saturates above 0.97 for every non-random rule at $k \geq 5$; the full inventory is Table S10.2.
