
Held-out pair support versus high-selectivity event support
A. Pair support versus event support
B. Per-pair error versus pair support
Observed high-selectivity events (+0.5)
Held-out rows per species-level pair
Pooled per-pair RMSE (Δlog K)
Observed high-selectivity fraction of the pair
upper edge: pairs where almost every
held-out row is a high-selectivity event
well-sampled pairs converge
to ~1–2 Δlog K
Cu/Ni
Cu/Zn
Co/Zn
Ca/Mg
Both axes are logarithmic; the pair inventory spans three orders of magnitude in support. Colour is the observed high-selectivity fraction,
not per-pair RMSE. Descriptive and label-informed; not used for selection or ranking.
